

**IN THE ABSTRACT**

Please cancel the originally filed Abstract and substitute thereto as follows.

A portable information terminal including a self-positioning measuring device is provided to make reservations and obtain status information of available services from a plurality of reservation centers and status information providers, via a communication network. Such a portable information terminal may comprise a reserving unit to access to a reservation center, and a reservation storage to store a reservation content of a reservation; a status information collecting and judging unit to collect status information relating to execution of the reservation content from the status information providers via the communications network and decide, based on collected information and position information obtained by the self-positioning device, whether to move to a location for execution of the reservation content, decide whether the reservation content is to be changed; an alternative reservation generating unit to collect, in the case where the status information collecting and judging unit judges that the reservation content is to be changed, information relating to an alternative reservation to show the alternative reservation; and a reservation change execution unit to cancel the current reservation and store the alternative reservation into the reservation storage.
